

Sydney Sexual Health Centre

The Sydney Sexual Health Centre provides a free, confidential and comprehensive service that helps put you in control of your sexual health. The service supports your sexual health by providing screening, vaccination and management of sexually transmissible infections including HIV and hepatitis B, women's and men's sexual health care, education, individual and couple counselling, and needle and syringe exchange. The service offers a choice of male and female doctors, nurses and counsellors who are respectful of your lifestyle and sexuality.

NO MEDICARE CARD REQUIRED

Hours:

Monday, Tuesday, Thursday, Friday 10am-6pm

Wednesday 2pm to 6pm

Telephone: (02) 9382 7440

Sexual Health Infoline: 1800 451 624

Monday - Friday 9am to 5: 30pm

What is HIV?

HIV (Human Immunodeficiency Virus) is a virus which destroys the body's natural ability to fight infections and some cancers.

What is AIDS?

AIDS (Acquired Immune Deficiency Syndrome) is a group of illnesses which occurs as a result of a weakened immune system in people who are infected with HIV. Without treatment of HIV, AIDS can occur several years after a person becomes infected with HIV.

How does someone become infected with HIV?

An infected person can pass the virus on to someone else by the exchange of body fluids such as blood, semen and vaginal fluids.

HIV is transmitted by:

- vaginal or anal sexual intercourse without a condom
- sharing drug injecting equipment
- an infected mother to her baby during pregnancy, childbirth, or breast feeding.

HIV is rarely transmitted by:

- vaginal or anal sex using condoms correctly
- oral sex without a condom (though ejaculation could increase the risk)
- sharp injuries or splashes (e.g. needle-stick injuries for health care workers)

HIV has never been reported as being transmitted by:

- kissing or cuddling
- shaking hands/social contact
- sharing knives and forks, cups or glasses
- toilet seats or mosquitoes

What is the HIV antibody test?

It is a blood test which detects HIV antibodies. Antibodies are produced by the body in response to an infection. If you are infected with HIV, then HIV antibodies will be present in your blood.

It can take up to three months for HIV antibodies to develop after a person has been infected.

Having a HIV test is entirely optional. If you request an HIV antibody test, you will have the opportunity to discuss the test and the possible implications of the results with a health care worker. If you decide to have an HIV test, it is completely confidential.

HIV test results are only given in person, not by telephone. The result takes about a week to come back to the clinic.

What does a negative HIV antibody test result mean?

It means either:

- that a person has not been infected with HIV
or

- that a person has been infected with HIV but has not yet produced antibodies. Remember it can take up to three months for antibodies to develop after infection with HIV.

What does a positive HIV antibody test result mean?

A positive test means that a person has been infected with HIV. All positive tests are confirmed by further testing.

Things to consider:

- Receiving a positive HIV antibody test result can be a traumatic event. Initial and ongoing support is available from this Centre and other agencies.
- Life insurance and visas for some countries can be restricted for people infected with HIV.
- Sometimes people with HIV experience discrimination, eg. in personal relationships, housing or employment.
- There is a legal requirement for people infected with HIV to inform present and future sexual partners.
- The Health Department receives statistics on the number of people with HIV or AIDS, but not names or addresses.
- All people thinking of being tested for HIV are invited to discuss any concerns with a counsellor, nurse or doctor.
- Any medical information or anything discussed at the Centre is confidential. Testing for HIV is always done on coded (not named) specimens.
